# AQUA-REUSE

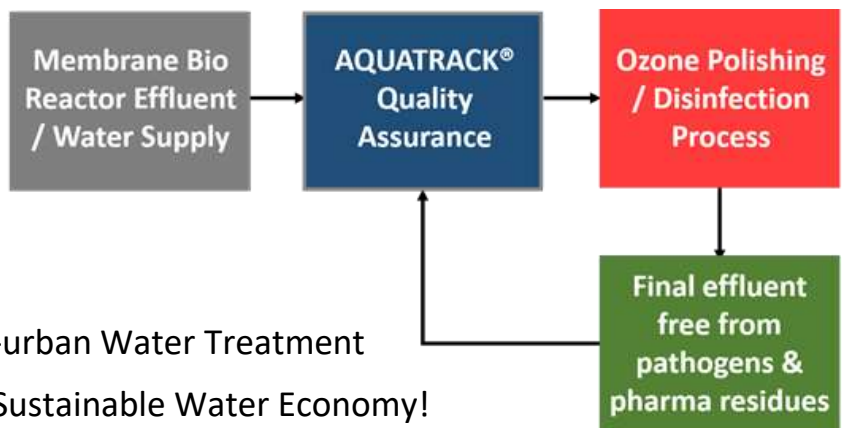

**Aqua-Q, a creative Swedish SME at the forefront of the industry with a core mission of quality control for early detection of microbiological contamination in drinking and source water and waste water for reuse. The company has developed a verified optical online monitoring & sampling solution AQUATRACK® for quality assurance of water for distribution infrastructure and industrial applications.**

AQUATRACK® Early Warning System is created in EU R3Water project to mitigate, the substantial threat from water contamination in combination with modular energy efficient, low cost ozone polishing system to provide a powerful process for water quality management to have better control of both pathogens & pharmaceutical residues in treated water. AQUATRACK® is now EU ETV verified to online monitor the quality of drinking water, source water & water for reuse.

Today there is **no** real time online monitoring & biological water sampling system for water treatment plants which can give quick information of quality variation in time to avoid the danger. State of the art of today water samples are randomly collected from time to time for microbial analysis to safe guard the microbiological quality of water, but random or periodic sampling methods have significant limitations.

Aqua-Q's contribution for water quality monitoring & environmental protection (protected)
